

Microsoft 365 Backup & Restore

Over half of all companies now rely on Microsoft 365 for email services and collaborations. Microsoft 365 offers a wide range of options and applications, which means your company is generating data all the time in a variety of locations. This has resulted in more data than ever before. At the same time, your company needs to control all this data, as well as protect it.

Why do you need to protect your Microsoft 365 data?

Microsoft 365 is a robust product. Microsoft has put a lot of effort into making sure the platform remains active. However, there are several important problems which every current or future Microsoft 365 user need to take into consideration.

- No point-in-time restoration of for mailbox items: Microsoft has stated that "point in time restoration of mailbox items is out of scope for the Exchange Online service". This means that, if a company is subject to an account takeover, ransomware attack or the removal of data by a malicious insider, there is no guarantee that lost data can be recovered.

"Shared responsibility model": Microsoft 365 operates on what is known as a 'model for shared responsibility'. This model determines that Microsoft is responsible for its global infrastructure and will ensure that Microsoft 365 remains accessible, but that clients are responsible for access to and the assessment of the data which is stored using the infrastructure made available by Microsoft 365.

- Local disruptions and data losses: Even though Microsoft 365 has a relatively safe global system (it achieved reliability of 99.97 percent in the first quarter of 2019), it frequently suffers local disruptions. These disruptions may result in data losses.

What are the limitations of the built-in security provided by Microsoft 365?

Microsoft 365 has some built-in security options, but it also has its limitations.

- The Recycle bin is insufficient: Files which have been deleted from the Recycle bin are truly lost after 30 days. The Recycle bin does not often provide its own type of data protection.
- Retention policies are resulting in increasing costs for data storage: A company's retention policy may result in an increase in storage use in applications like OneDrive and SharePoint. This can result in high supplemental costs because you are charged per gigabyte, per month.
- Rogue administrators: Furthermore, retention policies do not offer protection from rogue administrators, unless a Retention Lock is being used. However, this function cannot be switched off once it has been activated. This means that you are at risk of your consumption of storage capacity increasing dramatically which will result in additional costs.

Protect your Microsoft 365 data with DMP

DMP has developed a Microsoft 365 Back-up service based on a pay-per-use model without up-front investments. We will secure your Microsoft 365 data in the DMP cloud located at Teraco data centre. Retention can be selected based on your needs. A self-service portal makes restoring your data easy.
